A ~200 words paragraph demonstrating my understanding after completing lessons 8-10 on Vue Mastery:

word count:

After completing **Lab 3**, I started to clearly see how powerful **Vue** really is and where its true strength comes from. Vue does not just simplify JavaScript syntax; it provides a smart way to organize logic, data, and UI together. This lab helped me understand why Vue is widely used in modern front-end development.In **Lesson 8**, I learned about **Computed Properties**. I understood how Vue automatically caches computed values and only recalculates them when their dependencies change. This makes the application more efficient and improves performance. I also learned how to combine multiple variables from the data object into a single computed result, which helps keep the template clean and readable. **Lesson 9** was the most meaningful lesson for me. Creating a component and then reusing it across the application is extremely powerful and saves a lot of development time. I learned how **props** work and how data is passed from a parent component to a child component. This made the structure of Vue applications much clearer and more maintainable. In **Lesson 10**, I learned how **parent and child components communicate** using custom events. The child component uses emit to trigger an event, and the parent component listens to it using @event-name. This two-way communication model helped me fully understand how Vue manages component interaction in a clean and controlled way.
